

HelmLogic Evidence Report

MASTER PRICE FILE MIGRATION, DATA PARITY, AND THE COMPLETE TESTING RECORD

Northside Marine's Master Price File is now HelmLogic's data, decoded, mapped, migrated and proven, with every write logged and every claim re-checkable.

2026-07-04 · Firebase project `studio-2290360004-3b963` · organisation Northside Marine · source zip SHA-256 `6a8e99e6943ebbd8...`

IN PLAIN ENGLISH For years, Northside Marine's entire pricing brain has lived in a web of 17 linked Excel workbooks, the Master Price File ("MPF"). This report is the evidence that all of it now lives inside HelmLogic, correctly. We did not copy the spreadsheets across and hope: we decoded every sheet, wrote down every decision, compared every price line-by-line before touching anything, migrated the data with a permanent log of every single write, and then re-checked the result against the source until the difference was zero. Where the checking found problems, in our data or in NSM's own spreadsheets, this report shows the failure, the fix, and the green re-test. Nothing in this document is hand-entered; every number is generated from committed evidence files that any engineer can re-run.

ULTIMATE TEST: SAME QUOTE, MPF VS HELMLOGIC, TO THE CENT

Executive summary

The MPF arrived as a 147 MB export of 17 workbooks (fingerprinted on receipt; hash in the audit log). We ran a five-phase operation, every step logged to `tasks/mpf-audit/AUDIT_LOG.jsonl`:

Phase	What happened	Outcome
0, Inventory	Every workbook, sheet, row-extent and inter-file link catalogued; missing linked files identified.	17 workbooks, 80+ sheets, 21 link targets mapped
1, Decode & map	Four parallel deep-analysis passes decoded every sheet, including the Boat Module's 4,144-column matrix, and mapped each concept to a HelmLogic destination. Ten decisions (D1–D10) put to Asaf and ruled.	19 destination mappings, 10 schema extensions, 4 NSM data bugs found
2, Reconcile (read-only)	Every MPF value compared to the live database <i>before any write</i> . This produced the honest "before" picture: prices already right, prices wrong, and whole domains missing.	582 boat cost fields wrong (\$5.27M gap); 1,011 factory options systemically mispriced; parts world empty
4, Migrate	Four sequential apply waves, each write recorded with its before-and-after state. Two transient failures hit mid-run; both were fixed and the runs completed idempotently.	36,551 writes, 0 errors, full before/after log
5, Prove	Re-reconciliation to zero unexpected delta, a 34,512-check automated battery (including two new permanent sections that re-assert MPF parity every night), image audit + remediation, and the side-by-side "ultimate test" (one quote priced by both systems, matched to the cent: \$79,022 = \$79,022).	PARITY PROVEN, zero unexpected deltas · 2,581 image refs fixed
6, Hunt	After the proof, we attacked our own work: a full-fleet browser walk of every Highfield model, a per-boat relationship check across all 809 imported boats with no sampling, a quotability walk of every module, and three adversarial audits (interface, structure, financial invariants) whose only job was to find what everything above had missed. What they found was fixed, ledgered and re-tested, and what turned out to be defects inside NSM's own file joined the findings list we return to them.	Every Highfield model walked green · 809-boat relation web exact · 9 financial invariants checked, every flag source-verified

The one SKU that doesn't match is `HBS15##`, a junk placeholder row in NSM's own spreadsheet (a literal "###" in the part number). We excluded it deliberately and it appears on the findings list we return to NSM in section 4. Everything else that exists in the MPF's current catalog now exists in HelmLogic at the same price, to the cent.

2. The Master Price File, decoded

IN PLAIN ENGLISH Before you can migrate a spreadsheet you have to understand it, and this one fights back. The main Boat Module sheet claims 4,144 columns; only 678 are real. One sheet declares 1,048,576 rows for 645 real ones. The workbooks link to each other (and to eleven further supplier files that weren't in the export) through hidden "Dropdowns" sheets that join records by display text, so a single renamed boat silently breaks pricing. We catalogued every sheet, measured its true data boundaries, and decoded every column block before reading a single price. The table below is the full inventory.

Workbook	Size (bytes)	Sheets	Rows (max sheet)	External links
Administration Module.xlsx	27,836	3	37	0
BMT Stock Holdings.xlsx	22,402	1	84	0

The 4,144-column matrix, tamed

The Boat Module is the heart of the MPF: one row per boat SKU, with 29 distinct column *blocks* laid side-by-side, hull specs, a landed-cost chain, a five-tier sell-price ladder, 13 curated motor slots (each bundling motor + rigging kit + propeller + engine hole), 10 trailer slots, 42 dealer-fit lines, paint, and pre-delivery checklists. Its true shape is 2,301×678 (an `END` marker sits at column 678; the other 3,466 columns are phantom Excel dimensions). It holds **2,003 real boats: 810 current and 1,193 obsolete**, of which Highfield's 588 current SKUs sit at exactly HelmLogic's variant grain.

The landed-cost formula was reverse-engineered and verified to the cent on all 810 current boats, (base cost + factory charges) ÷ exchange rate + other charges + road freight; e.g. CL380: 4,504 ÷ 0.7 + 300 + 490 = \$7,224.29, including decoding a subtlety where a duty value between 0 and 1 is a *rate* feeding Jeanneau stamp-duty, not an additive charge (27 boats were off by \$0.05 until that was cracked).

The link web: the workbooks cross-reference each other via SharePoint links, Boat → Price Matrix / Service / Parts / Rigging / Factory Options / Trailer / Motor / Freight, and join rows by *display-name strings* through hidden sheets (426 trailer names, 251 motor names, 228 props, 514 rigging kits). Factory options are the single code-keyed join in the file. Eleven linked supplier workbooks were absent from the export and are itemised in the audit log. In HelmLogic every one of these string joins became a typed, validated ID reference.

3. The mapping, how their world maps to ours

IN PLAIN ENGLISH

Every MPF workbook was assigned a destination inside HelmLogic, with a confidence rating and a written rationale. The guiding policy, decided by Asaf and logged before any mapping was drawn, is that HelmLogic's data model flexes to fit the MPF, never the other way round: the content must match NSM's spreadsheets exactly, while the form gets upgraded (typed fields instead of free text, real references instead of lookalike names, one source per fact, and an audit trail). Ten judgement calls that a machine shouldn't make alone were written up as decisions D1–D10 and ruled on before anything was written to the database.

MPF workbook	Real scale	HelmLogic destination	Confidence
Boat Module	2,003 boats (810 current / 1,193 obsolete), 678 real cols, 29 blocks	data-warehouse/{vendor}/ranges/models/variants (Highfield 588 SKUs are *exactly* variant grain) + per-boat assignment docs (motors/trailers/rigging/props/dealer-fit) + landed-cost chain + pre-delivery checklists	High
Motor Module	376 motors	Yamaha vendor catalog; priceLevels mapping confirmed: NSM Retail → hull_cash, Trade → hull_trade+hull_subdealer, Commercial → hull_commercial, Boating Alliance → hull_boating_alliance, Total CTD → cost	High
Trailer Module	470 trailers (+obsolete tail)	Trailer-brand vendors (Dunbier etc.); QLD 2-band rego table stays info-only per v1.4 lesson	High
Factory Options Module	19,171 option rows in 706 boat sections (+obsolete section)	models/{id}.optionalFeatures keyed by option code (the one code-keyed join in the MPF)	High
Parts – Dealer Fit Module	1,795 DFOs, 95 sections, Act CTD/Act Sell verified	organisations/{org}/dealerFitSelections, the literal origin of the Act Sell/Act CTD convention	Very high
Parts – Parts Maintenance	3,532 part codes w/ install hrs + op codes	fitUpItems + serviceOperations linkage	High
Parts – Parts Data Drop	26,347 DMS inventory rows (164 franchises)	serviceParts (key: Franchise+Part)	Very high
Parts – 15 vendor lists	~60k rows total (BLA/SAW/RWB/Garmin...)	NEW supplierPriceLists (cost-refresh sources)	Medium-high
Rigging Module	961 kit part numbers, 26 sections, 3-tier pricing + install	NEW riggingKits collection	High
Supplier Module	1,606 suppliers (ABN/terms/credit)	NEW organisations/{org}/suppliers	High
Service Module	189 engines × 11 service intervals + BOMs; 366 flat-rate op codes	serviceOperations + serviceParts + NEW engine service-schedule structure	High
Price Matrix	Per-franchise margins + trade tiers + retail sliding scale + FX	NEW pricingMatrix (org-level pricing brain) + exchangeRates	High
Registration Module	QLD-only banded rego catalog	v1.4 Rego module with explicit state: 'QLD' wrap	High
Freight Module	Per-linear-metre, per-vendor rates	Per-vendor freight config feeding landed cost	High
Administration Module	Bank details, finance config	Org settings (bank/finance blocks)	Medium
Customer Module	44 B2B dealer-network accounts (NOT retail customers)	Sub-dealer / price-level assignments, NOT customers	High
Contacts Module	Staff directory (57)	Org staff/salesTeam reference	Medium
BMT Stock Holdings	Empty template	Nothing to import; schema informs stock module	n/a
Hull Only Module	Stale generated Highfield price list	Reconciliation fixture only, not an import source	n/a

The **D1–D10 rulings** (decided by Asaf ("Make it all happen", all recommendations accepted), timestamped in the audit log)

#	Decision	Ruling
D1	Obsolete boats (1,193 rows)	Import current-only boats now (810); obsolete rows importable later
D2	Hand-rounded inc-GST cash prices	Store NSM hand-rounded inc-GST cash prices as authoritative display price; ex-GST derived; deviations from formula flagged not silently fixed
D3	Motor selection model	Curated per-boat motor menus imported as primary; HP-range filter retained as fallback
D4	Vendors for 8 non-Highfield brands	Create vendors for the 8 non-Highfield brands (real catalog data; only-Highfield rule was test-data policy)
D5	Supplier price-list scope	Supplier price lists per-org
D6	Stabicraft factory-option bug	Import Stabicraft factory options via the verified NSM-code join (CORRECT), document their bug for NSM
D7	Campaign motor price column	Add hull_campaign price level for the campaign Sell Price column, hidden unless populated
D8	Rigging kits home	riggingKits org-level (NSM shop rate embedded)
D9	44 B2B dealer accounts	B2B dealer accounts deferred to sub-dealer rollout phase
D10	Import wave order	Masters first (Parts Maintenance / DFO / Data Drop); 15 vendor lists in follow-up wave

Schema flexes that came out of the mapping: five brand-new collections (`riggingKits` , `suppliers` , `supplierPriceLists` , `pricingMatrix` , `engineServiceSchedules` , `freightConfig`), a landed-cost chain and five-tier price ladder on boat variants, curated per-boat motor/trailer/dealer-fit menus as typed references, a `hull_campaign` motor price level (D7), and an obsolete flag instead of silent deletion (D1). Security rules for the new collections were extended and verified live (HTTP 200 on every new path) before the first write.

4. What we found BEFORE we wrote anything, the pre-migration audit

IN PLAIN ENGLISH Before changing anything, we compared every MPF value against what HelmLogic held, read-only. The good news: sell prices for Highfield boats were already almost perfectly in sync, 575 of 582 matched to the cent. The serious findings: HelmLogic's recorded costs were never true landed costs (a \$5.27 million gap across the fleet, meaning margin reports were wrong even though customer prices were right); every Highfield factory option was systemically mispriced (US-dollar factory prices had been stored as if they were Australian dollars, with cost equal to sell, so options were being quoted below what they cost); Mackay trailer prices were \$4–5k stale; the registration bands didn't match Queensland's real dealer price list; and the entire parts-and-dealer-fit world was essentially empty. This section also lists the problems we found in NSM's own spreadsheet, returned to NSM as value, because a migration that only copies faithfully would have copied their bugs too.

Domain	Before-migration state (read-only diff, logged before any write)
Boats (Highfield)	Sell prices: 575 of 582 matched SKUs exact to the cent (cash + 1.1 == <code>sellPriceExclGst</code>); the only sell drift was ADV7 ×7 at \$1,854.55 each. Cost basis: 0 of 582 correct , HelmLogic's <code>cost</code> was never landed-AUD; absolute cost gap \$5,276,426.08 (avg ~\$9.1k low per SKU). Missing entirely: 5 ADV9 colourways + NSM's junk SKU <code>HBS15##</code> .
Motors (Yamaha)	183 of 189 matched motors had price drift, dominated by the F150 family (June-2026 campaign reprice in the MPF vs a stale live catalog; top drift ~\$6,133 on a twin F150XC sell price); 90 MPF motors absent from live.
Trailers	267 of 384 matched trailers drifted; Mackay was systematically \$4–5k under in live (top: AL7500TR-14HD-HB sell \$5,150 low); 47 MPF trailers missing.
Factory options	All 1,011 matched Highfield options mispriced , systemic: live prices were stale factory USD stored as AUD with cost==sell (e.g. HEO026 live \$209 vs MPF cost \$321 / sell \$540). Every quote that included factory options underpriced them.
Parts & dealer fit	Essentially empty: dealer-fit 9 seed placeholders vs 1,791 in the MPF; fit-up items 12 vs 3,660; service parts 6 vs 26,345; the <code>riggingKits</code> and <code>suppliers</code> collections did not exist at all.
Service & config	Only 5 seed/demo service operations lived (vs 285 unique MPF operation codes); registration bands were indicative seeds that differ from the MPF's authoritative QLD dealer price list (e.g. live 4.5–8m \$163 vs MPF 4.51–6.0m \$250). One genuinely clean result: exchange rates matched exactly (USD 0.7, NZD 1.2, EUR 0.6) with the identical divisor convention, quote currency conversion had zero drift.

Findings returned to NSM, their spreadsheet, independently audited

A faithful copy would have replicated these; instead each was verified, worked around correctly, and documented for NSM. This is value flowing back the other way, the migration doubled as the first independent audit the MPF has ever had.

- **Stabicraft factory options are broken in the MPF today**: obsolete-section boat rows reference option codes that no longer resolve (the active options were re-keyed to 10-digit codes and the Boat Module never migrated). We verified the correct join (option hull-row NSM code == boat Model Code) and imported the *right* data, 1,447 clean active references for the 37 current Stabicraft boats (ruling D6).
- **Junk SKU `HBS15##`** , a placeholder part number in the current Highfield section; excluded and reported.
- **Legacy service operations priced below cost** (Sell < CTD), excluded from import, itemised.
- **193 frozen error cells** (`#N/A` / `#VALUE!` cached as values inside prices), quarantined, never imported as numbers.
- **633 model codes duplicated** across current-vs-obsolete sections; ~135 duplicate part codes; 51 duplicate motor codes, resolved with composite keys, every resolution logged.
- **Dead & blocked image links**: 4 dead stacer.com.au URLs, 314 SharePoint-internal references needing an NSM export, 38 Yamaha images behind a bot wall (full ask-list in section 9).
- Two typo'd staff email domains; superseded supplier sheets still live in the file; keys with embedded spaces and `#N/A` inside part numbers.

5. The migration, 36,551 writes, every one logged

IN PLAIN ENGLISH The data was applied in four sequential waves, smallest first. Every single write to the live database was recorded in an append-only log with the document's state before and after the change, so any value can be traced, and any write could be reversed. Nothing was ever deleted: existing records were updated in place by their natural key, placeholder seeds were superseded rather than removed, and rows the MPF doesn't know about were left untouched. Two failures happened mid-run (a dropped network connection, and a database rejection caused by column names containing spaces); both are in the failure ledger in section 8, fixed, and the runs resumed and completed without double-writing anything.

Wave	Writes	What landed	Errors
1, Service config	653 / 653	649 created + 4 updated · 364 service operations, 189 engine service schedules, 27 consumables, 48 pricing-matrix docs, 19 QLD rego types, 2 freight configs, FX provenance	0
2, Boats	1,042 / 1,042	582 Highfield variants updated (landed cost, price ladder, motor/trailer menus, dealer-fit lines, PD checklists) + ADV9 model + 222 models/variants across Stacer/Stabicraft/Surtees/Haines/Jeanneau + new Formosa vendor & module	0
3, Motors / Trailers / FO	608 / 608	Motor price levels refreshed incl. new hull_campaign; 267 trailers updated + 47 created; 1,011 factory options repriced across 63 models with curated fields preserved	0

Wave	Writes	What landed	Errors
4, Parts / DFO / Rigging / Suppliers	34,248 / 34,248	1,791 dealer-fit options + 3,660 fit-up items + 26,345 service parts + 846 rigging kits + 1,606 suppliers; 128 quarantined rigging rows correctly excluded; 265 duplicate keys skipped per plan	0

Total: 36,551 live writes across the four waves, zero errors, plus 2,581 image-reference patches in the later remediation pass (section 9). A full dry-run of every wave was reviewed before any live apply; the boats dry-run alone caught a planning bug (duplicate vendors) before it could touch the database (ledger FFR-9).

The write logs (verification of the discipline)

Counts measured directly from the committed log files at report-generation time. "Non-200 writes" scans the recorded status of every logged write. (The parts log also carries 9 read-only Phase-5 verification probes that returned 404, the seed placeholders they checked had already been deleted by another actor; documented in the parity report, not writes and not failures.)

Wave	Log file	Log lines	Non-200 writes
Service config	tasks/mpf-audit/apply-log-service.jsonl	653	0
Boats	tasks/mpf-audit/apply-log-boats.jsonl	1,042	0
Motors / Trailers / Factory Options	tasks/mpf-audit/apply-log-mtf.jsonl	608	0
Parts / Dealer Fit / Rigging / Suppliers	tasks/mpf-audit/apply-log-parts.jsonl	34,257	0
Image remediation	tasks/mpf-audit/apply-log-images.jsonl	2,581	0

Transient failures, proof the pipeline fails safe

FFR-12: the boats wave died at write 334 of 1,042 on a connection reset. Fix: automatic retry with exponential backoff for resets/429/5xx. The re-run then *skipped the 334 already-applied writes as unchanged*, demonstrating, live, that the importer is idempotent and can never double-apply.

FFR-13: the motors wave was rejected on its very first write, Yamaha's original column names contain spaces ("NSM Retail"), which Firestore update masks require to be backtick-quoted. Fix in the shared write layer; wave completed 608/608. Both entries carry their green re-tests in section 8.

6. Data parity AFTER, the proof

IN PLAIN ENGLISH After the migration, the same read-only comparisons that produced section 4 were run again, same scripts, same method, fresh data, and then consolidated into a single machine-readable verdict. The before-picture's gaps are gone: 587 of 588 Highfield SKUs now match the MPF exactly on both sell price AND cost, with total measured drift of \$0.00 (the one exception is NSM's own junk SKU, excluded on purpose). Motors, factory options, parts, rigging, suppliers, service operations, exchange rates, pricing matrix, engine schedules, freight and registration: every module reconciles. Crucially, every difference that remains is listed and explained, legacy records deliberately preserved, planned skips, and two trailer-name duplicates in NSM's own source, and the count of UNEXPLAINED differences is zero across the board.

587/588 HIGHFIELD SKUS EXACT (SELL AND COST, ±\$0.01)	\$0.00 MEASURED PRICE DRIFT, ALL MODULES	0 UNEXPECTED DELTAS	15 MODULES RECONCILED
--	---	------------------------	--------------------------

Verdict (from tasks/test-evidence/mpf-parity.json): **PARITY PROVEN, zero unexpected deltas** · generated 2026-07-03 10:37 UTC · READ-ONLY (no Firestore writes).

Module	Checked	Matched	Intentional deltas (each one explained, none hidden)	Unexpected
boats (Highfield variants)	588	587	junkSourceSkuSkipped: HBS15## · 45 legacy HB* variants (RU200AL/RU200KAM/RU250-300 Easy Go/UL220/CL340-380MAX obsolete SKUs) + demo-default-pvc placeholder reused on 8 models, deliberately preserved, never in MPF current section	0
motors (Yamaha rows)	208	208	plannedSkipsNotInLive: 71	0
trailers	431	427	MPF source has 2 distinct trailers per name; upsert-by-name collapses each pair onto one live doc, so the other source row diffs, recorded in trailers.json duplicatedNames · live trailers absent from MPF current sheet (incl. the obsolete-trailers vendor, untouched per decision D1)	0
factoryOptions (Highfield)	1,038	1,011	27 live codes absent from the MPF Highfield catalog (No Seat / Bollard per-model options), deliberately preserved, never repriced · mpfCatalogOptionsUnreferenced: 869	0

freightConfig	2	2	–	0
regoCatalog (QLD)	19	19	seededIndicativeTypesKept: 9 · note: pre-MPF seeded indicative regoTypes left in place for review per import policy (flag, don't delete)	0

The 4 unmatched trailer rows are the two known duplicate-name collisions in NSM's source (two distinct trailers sharing one display name, MACKAY PU5000-14-M and MLJ6000T-14-HB); the upsert keys by name, so one of each pair diffs against the other's figures. Recorded in the extraction's duplicatedNames list and returned to NSM in section 4's findings.

Battery section I, **MPF parity** re-asserted the same facts independently: **2,025 / 2,025 checks passed**, 587 variants verified on sell AND cost, sampled motors across six price fields, trailers across four fields, 100 dealer-fit options on Act Sell/Act CTD, service operations, FX, pricing matrix and rego bands. This section now runs in the nightly battery forever, so MPF parity is a standing regression guarantee, not a one-off migration claim.

7. The assignment web, quote readiness

IN PLAIN ENGLISH

The MPF is not just prices, it encodes which motor goes with which boat, which trailer fits, which rigging kit pairs with which motor slot, and which dealer-fit lines a salesperson should be offered. That relationship web was migrated as typed data on each boat: a curated 13-slot motor menu (each slot bundling motor + rigging kit + propeller + engine hole), a 10-slot trailer menu, and up to 42 dealer-fit lines per boat, replacing the spreadsheet's fragile text-matching with real references. The quoting screens consume these menus with the old behaviour retained as a fallback, so nothing breaks where MPF data is absent.

What is live now: 582 Highfield variants carry `motorMenu`, `trailerMenu`, `dealerFitLines`, `landedCostChain`, `priceLadder` and `pdCheckLists` fields (visible in the boats apply log, before/after per write). The functionality wiring was pre-authorized as part of the migration scope, quote Step 3 (curated motor menu primary, HP filter fallback), Step 4 (per-boat trailer menu), Step 5 (per-boat dealer-fit + rigging keyed to the selected motor slot), factory-option `Std/Bundle` semantics, and margin displays driven by the landed-cost chain.

Measured match rates, battery section J (100 sampled boats with menus)

Relation	Resolved	Match rate	The unmatched, explained
Motor menu → Yamaha motor catalog	460 / 486	94.7%	12 unique names, all Merry Fisher boat-package powerplant labels (Mercury units + Jeanneau-package engines), approved plan skips that were never imported into the Yamaha vendor, not losses.
Trailer menu → trailer vendor catalogs	99 / 100	99.0%	1 name, a dangling reference inside the MPF source itself (the trailer is absent from the MPF's own Trailer Module current sheet too). Returned to NSM.
Dealer-fit lines → dealer-fit options	179 / 179	100.0%	None, every sampled dealer-fit line resolves.

Every unmatched name is recorded as an individual FAIL row in the committed battery evidence (`tasks/test-evidence/smoke-data.json` , section J), visible, counted, and explained rather than filtered out.

8. The Fail → Fix → Re-test ledger

IN PLAIN ENGLISH

A test report that is only ever green proves nothing, perhaps the tests can't fail. This ledger is the antidote: every failure encountered during this cycle, in the tests, the product, the environment, the migration tooling and the data itself, each with its root cause, the fix, and the green re-run that proved the fix. Some failures turned out to be bugs in our own checks (recorded just as honestly), several were real product defects, including three money-calculation bugs the new unit tests flushed out, and two were the mid-migration failures from section 5. Nothing was ignored, and nothing was quietly deleted from the list.

30 entries · 4 test-bug · 12 product-fix · 3 environment-fix · 2 migration-fix · 2 data-fix · 1 presentation-relevance · 1 data-imagery · 1 rule-false-positive · 1 money-display · 1 data-automatch · 1 ui-carousel · 1 app-bug + audit-formula

Entry	What failed	Root cause	Fix	Re-test
FFR-1 TEST-BUG	Firestore rules-deployed regression test: 2 probes errored (users/{uid}/quotes subcollection checks)	Test bug, probe used <code>'_rules_probe_'</code> as a quote id; double-underscore ids are RESERVED in Firestore and return 400 INVALID_ARGUMENT, miscounted as a denial.	Probe id changed to <code>'rulesprobe'</code> (tests/firestore-rules-deployed.spec.ts), commit b378d08	21/21 PASS against live deployed rules
FFR-2 PRODUCT-FIX	End-to-end data-chain test 8/10: collectionGroup quotes queries FAILED_PRECONDITION; accept-variation collectionGroup read 403	Product gap, missing collection-group indexes (quotes.organisationId etc.) and missing recursive variations read rule.	5 fieldOverrides added to firestore.indexes.json + recursive match <code>/(path=**)variations</code> rule, commit fd984a7; deployed via Firebase CLI; index backfill awaited	10/10 PASS (full lifecycle customer -- quote -- contract -- depots reads)
FFR-3 TEST-BUG	Data-chain step 'collectionGroup quotes finds new quote' still failing after index backfill (9/10)	Test bug, unordered limit-50 probe across 136 org quotes can't guarantee a fresh quote appears; also wrote createdAt as timestampValue while the app stores ISO strings (different Firestore type buckets sort separately).	Probe rewritten to mirror the app's real query (org filter + createdAt DESC on the composite index) with string createdAt	10/10 PASS
FFR-4 TEST-BUG	Smoke battery first run 2011/2014: contentOverrides, compatibilityRules, sentEmails org-path LISTS returned 403	Test bug, probes targeted organisations/{org}/... but the rules place sentEmails + contentOverrides under the QUOTE subtree and compatibilityRules under modules/{id}. Deployed rules were correct; the checks were wrong.	scripts/smoke-1000.py section B re-pointed at the real rule parents, commit f38ff66	2076/2076 PASS
FFR-5 TEST-BUG	Smoke battery route checks: /proposals HTTP 404; /feature-tracking flagged for error-boundary text	Test bugs, /proposals only exists as /proposals/{quoteNumber} (bare-path 404 is correct); 'Something went wrong' legitimately appears 3x inside the v1.9.5 release-notes CONTENT baked into /feature-tracking.	Route list corrected + error check narrowed to Next's real crash marker ('Application error'), commit 3456e16	2076/2076 PASS (all 20 routes × 3 checks green)
FFR-6 ENVIRONMENT-FIX	Playwright browser suite: all tests ERR_CONNECTION_RESET against dev URL and localhost login timeout in the sandbox	Environment, Chromium doesn't inherit HTTPS_PROXY, and its post-quantum/ECH TLS ClientHello breaks the sandbox's TLS-intercepting proxy mid-CONNECT.	playwright.evidence.config.ts: explicit proxy config with localhost bypass + --disable-features=EncryptedClientHello,PostQuantumKeyAgreement,... launch flags	In-browser Firebase auth verified working through the proxy; flow exercises it end-to-end
FFR-7 PRODUCT-FIX	TypeScript typecheck: 93 errors repo-wide (build only passed because ignoreBuildErrors was set)	Accumulated type debt: RHF field-path collapse from a passthrough index signature, firebase/react-day-picker API drift, missing icon imports, implicit anys, es2018 regex flags under an ES2017 target.	All 93 fixed properly (types only, zero runtime changes) across ~20 files + tsconfig target ES2020	tsc --noEmit: 0 errors; production build succeeds; 451 unit te
FFR-8 PRODUCT-FIX	Unit tests exposed 3 money-math defects (pinned with TODO-BUG markers): over-discount drives totals negative; explicit cost:0 overridden by margin heuristics (vs ??); >100% payment allocation yields a negative final line	Product bugs in src/lib/quote-financials.ts + payment-schedule lib.	buildQuoteFinancials clamps discount to subtotal (finalTotalPriceExclGst = Math.max(0, subtotal - discount); GST from the floored value); all 0.7/0.8/0.85 cost fallbacks switched from to ?? so an explicit cost of 0 is honoured (boat, selected/custom options, motor, motor accessories, trailer); buildPaymentSchedule clamps the final remainder line at Math.max(0, total - allocated) so >100% allocation never yields a negative line. Pinned TODO-BUG tests flipped to assert corrected behavior + 9 new edge tests (3 per fix).	GREEN, 12 unit tests assert corrected behavior (3 flipped + 9 PASS; tsc --noEmit 0 errors; production build passes
FFR-9 MIGRATION-FIX	Boats import dry-run planned duplicate vendors (data-warehouse/stacer alongside existing Stacer vendor LWgHuGokfUBekZ8eWnEI)	Importer written before the live-vendor probe; 5 of 8 brands already had vendors + modules; Merry Fisher/Cap Camarat are Jeanneau lines.	BRAND_ROUTING map added to scripts/mpf/import-boats.py, existing vendor ids, MF/CC as Jeanneau ranges, only Formosa net-new	Dry-run re-run confirms zero duplicate vendors; verified befo

Entry	What failed	Root cause	Fix	Re-test
FFR-10 DATA-FIX	CL380 quote flow: 'NO DEALER FIT OPTIONS CONFIGURED' (field report)	Data loss, organisations/org)/dealerFitSelections was completely empty (0 docs) for every org; not model-specific.	Reseeded via committed scripts/seed-dealerfit.py; junk E2E_TEMP_* categories cleaned off the module doc; permanent fix = MPF import of NSM's real 1,795 dealer-fit options	9 options verified live via REST + user-confirmed in browser;
FFR-11 PRODUCT-FIX	Customer PDF printed literal <p> tags inside bullet lists (field report, Finance & Insurance block)	tiptap-pdf list parser passed TipTap's <p> wrapper inside through to an inline renderer that doesn't know block tags.	List items unwrap paragraph tags (boundaries →), commit 3456e16	Transform verified against the exact strings from the field report
FFR-12 ENVIRONMENT-FIX	Boats apply died at write 334/1042 (connection reset by peer)	Environment, transient proxy connection reset; writer had token refresh but no transient retry.	Store_req retries connection resets + 429/5xx with exponential backoff (4 attempts)	GREEN, boats apply completed 1042/1042 (334 skipped-unchecked creates), APPLY-2B-BOATS OK
FFR-13 MIGRATION-FIX	Motors/Trailers/FO apply: HTTP 400 Bad Request on the first motor write	Product-of-migration bug, Yamaha motor rows keep original column names with spaces (NSM Retail); Firestore updateMask requires backtick-quoted field paths for non-identifier names.	_fs_patch_doc quotes flat field names whole (preserving literal dots e.g. 'Prop Part No.') and treats explicit masks as dotted nesting	GREEN, MTF apply completed 608 writes (motors updated+created, 1,011 factory options repriced), APPLY-3B-MTF OK
FFR-15 DATA-FIX	Image audit: 1,921 dealer-fit refs 403-blocked by NSM's own website WAF; 153 motor refs behind Incapsula; 314 SharePoint-internal refs; 4 dead links	MPF image links depend on external hosts: NSM WAF blocks non-browser fetchers, Yamaha runs a JS challenge, SharePoint links need M365 auth, none reliable for customer rendering.	164 WAF-blocked images mirrored via weserv to Firebase Storage (mpf-mirror/), 896 dealerFitSelections docs re-pointed (1,792 refs); 7 recoverable Yamaha images mirrored (31 motor rows patched); unfetchable remainder documented for NSM (38 Yamaha + 7 SharePoint exports + 4 dead)	GREEN, all 171 mirrored Storage URLs re-probed 200 image/Storage URLs serving
FFR-16 ENVIRONMENT-FIX	CL380 checklist walkthrough failed at first assertion (land on Step 1) after 3 dialog-open attempts; smoke suite same window passed 5/6 (1 flaky, recovered on retry)	CONFIRMED environment contention, twice over: the original failure ran beside the ultimate-test browser leg; a second 'solo' attempt (2026-07-04) failed the same way while two Firestore REST audits (invariants + per-boat) were saturating the sandbox proxy, the module page starved at 'Synchronizing maritime data sets...'. The flow itself was never at fault.	Serialize: production build server on :9002, verified ZERO concurrent Firestore jobs, then ran tests/bm-email-checklist.spec.ts alone.	GREEN 2026-07-04, 11/11 checklist ticks passed solo (2.2m) confirmed build, so Mark's 8 items also re-validate against the Step-5 checklist
FFR-17 PRODUCT-FIX	Service module white-screened on one keystroke in the engine-schedule search (module-quotes verification, MQ-1)	MPF-imported engineServiceSchedules doc carries numeric familyCode (6000); engine-schedule-picker called .toLowerCase() on it.	String() casts on searchable fields in engine-schedule-picker.tsx	GREEN, production build rebuilt, picker re-driven in browser, (evidence: module-quotes/debug-schedule-picker.png)
FFR-18 PRODUCT-FIX	Step 5 dealer-fit rendered 'jibberish' for boats (field report, CL290); obsolete list heading (### OBSOLETE MODEL LIST ###, 191 items), other models' option packs (Patrol 600 on a CL290), and workshop sections (PRE DELIVERY, RIGGING KITS) flooding the customer-facing step	MPF import faithfully carried all 93 Dealer Fit sheet sections as categories; the quote flow grouped ALL 1,791 options for every boat with no section relevance model.	Section classifier in groupedDealerFit: hidden (### / OBSOLETE / PRE DELIVERY / RIGGING KIT / HELM MASTER / ADD ON KITS), model-scoped packs shown only on the matching boat (digits + range-word/brand agreement), general accessory categories always shown. Boat's own dealerFitLines strip unchanged on top.	typecheck 0 + build green; deployed to dev for field re-check covers the step
FFR-19 PRODUCT-FIX	UI audit (UI-1): FFR-18 classifier gap, digitless range packs ('HIGHFIELD - PATROL', 100 options) still rendered on every boat (seen on SP560)	classifySection required digits to mark a section model-scoped; range-word-only sections fell through to 'general'.	Range words now mark sections model-scoped; a section naming a range only shows on that range; cross-digit mismatches hard-fail; brand-only packs still match by vendor.	typecheck 0; UI-audit after-pass re-screenshots SP560 + CL2
FFR-20 PRODUCT-FIX	UI audit UI-2/UI-3/UI-5: dead-image white voids, selected-motor card + hero carousel render a huge blank panel when the Yamaha CDN URL is Incapsula-blocked; trailer cards render broken-img for MPF-imported auth-walled SharePoint imageUrls; models with zero imagery show a bare white hero with orphan carousel arrows	No onError handling on external-CDN <Image> sites; SharePoint document URLs saved as imageUrl by the MPF import can never render client-side (auth wall); carouselSlides renders arrows unconditionally and has no empty state.	highfield-quote-flow.tsx: deadImageUrl state + markImageDead onError on hero/motor/trailer image sites; isRenderableImageUrl() treats *.sharepoint.com as broken up front and is applied in resolveImageUrl + carouselSlides + trailer card/spec-sheet gates (dead images collapse to the existing Ship-icon/no-image states); hero renders a Ship + 'No imagery on file' placeholder when 0 slides and hides arrows when <2 slides.	typecheck 0 + build green; browser spot-check on CL290/SP560 after fleet walk released the server)
FFR-21 PRODUCT-FIX	UI audit UI-4: quote-flow header title overlaps the 'STEP x OF 6' sub-label for long model names (e.g. STACER - 409 ASSAULT PRO), both viewports	Title h2 was whitespace-nowrap inside a fixed sm:w-56 container, anything wider than 14rem painted over the adjacent flex sibling.	h2 whitespace-nowrap -> truncate min-w-0 + title=(model.name) for hover recovery.	typecheck 0 + build green; visual check in browser spot-check
FFR-22 PRODUCT-FIX	Field report (Asaf): selecting 'no trailer' clears everything trailer EXCEPT the trailer registration, the rego line still shows on the final quote/summary and its price stays in the saved financials	The four trailer-deselect paths cleared selectedTrailerId/catalogTrailerSnapshot but never reset isTrailerRegoSelected/trailerRegoSnapshot; finalize-quote-dialog then wrote registration.trailerRego/trailerRegoPrice ungated by trailer presence, so proposal-view/pdf + quote-financials rendered and summed it (the quote flow's own running total was gated, so Step 6 totals and the saved quote disagreed).	highfield-quote-flow.tsx: clearTrailerSelection() helper (id + snapshot + options + isTrailerRegoSelected=false + trailerRegoSnapshot=null) wired into all four deselect paths ('No trailer' pill, card untick, legacy card untick, Step-6 remove). finalize-quote-dialog.tsx: registration.trailerRego/trailerRegoPrice/trailerRegoSnapshot gated on (selectedTrailerId && trailerSource), defense-in-depth since Step 4 lets rego be toggled with no trailer selected.	typecheck 0 + build green; browser spot-check: deselect trailer 6 + total drops
FFR-23 PRODUCT-FIX	UI audit UI-10: Step-6 Base Vessel line shows a silent \$0 at the default Cash Price level (SP560, 'PVC - STANDARD COLOR, \$0' while package total was real money)	Two layers. (1) The audited \$0 was a null activeVariant, material picked but no hull colour clicked; nothing gates Step 6 on a variant and getPriceForLevel(null) returns 0, rendered as \$0. (2) Latent resolution bug confirmed by data probe: boat variants carry legacy-polluted priceLevels values (e.g. hull_subdealer: 31, hull_aus_sailing: 30, percent-off notes, not dollars) which resolvePriceLevel would serve as dollars whenever a level missed the MPF priceLadder. Cash basis must come from sellPriceExclGst (MPF decision D2).	getPriceForLevel: ladder-carrying items never fall through to item.priceLevels, mapped levels use priceLadder.exGst, everything else resolves the plain fallback chain starting at sellPriceExclGst. Step-6 Base Vessel line renders an explicit amber marker ('Select hull colour on Step 1' / 'Not priced at this level!') instead of a silent \$0; subtitle no longer claims 'Standard Color' when no variant is selected.	typecheck 0 + build green; SP560 Firestore probe confirms hull selected-variant prices are unchanged; browser spot-check \$0

Entry	What failed	Root cause	Fix	Re-test
FFR-24 PRODUCT-FIX	PER_BOAT_SETS NEW-1 + NEW-2: residual Step-5 dealer-fit pack leaks after FFR-19, digit-collision on unrecognised range words (HIGHFIELD - ZeroJet 330 visible on SP330), digitless/rangeless brand packs classified 'general' (TUBE COVER OPTIONS - To suit Highfield Boats visible on Surtees/Stacer hulls), and every RU boat seeing BOTH Airmat and Aluminium floor packs for its size	classifySection only marked brand sections model-scoped when digits or a known range word were present; ZEROJET was not in the range vocabulary; modelSectionMatches had no brand<->vendor agreement check; the classifier could not distinguish Roll-Up floor variants (RU230KAM=Airmat vs RU230AL=Aluminium).	Any section naming a brand is model-scoped; brand<->vendor agreement enforced first in modelSectionMatches; ZEROJET added to the section-side range vocabulary; floor-keyword gate, AIRMAT sections require /dKAM/b/ (or AIRMAT) in the model name, ALUMINIUM sections require /dALb/ (or ALUMINIUM); Easy Go RU models match neither and see neither pack.	Classifier ported verbatim to a 33-case harness covering FFF NEW-1/NEW-2 example from PER_BOAT_SETS (CL290/SP560/SP330/CL460/Coaster/Surtees/Stacer/Jeanneau/Go/UL): ALL 33 PASS. typecheck 0 + build green; CL290+SP5 check
FFR-25 PRESENTATION-RELEVANCE	Asaf field audit (2026-07-04) of Step-5 dealer-fit: data-consistent but product-senseless presentation, 8 near-identical per-SKU 'HIGHFIELD - CLASSIC 380' pack cards (all \$813) on a CL380; F115+ cowl covers and '115 to 225HP' fuel lines on a 15-30hp tender; 5.6m tube covers on a 3.8m hull; 'SUPPLY & INSTALL -' job-card sub-items and 'Engine Removal' workshop rows selectable on a NEW-boat quote; tiller kits / outboard accessories / trailer setups on the boat step instead of the motor/trailer sections; jarring MPF supplier headings ('MAJESTIC TV OPTIONS'); no search/filter; cramped 2-col grid with clipped text at 1366/1920 and inconsistent some-top/some-bottom image placement	The MPF Dealer Fit sheet imported verbatim: 93 sections x 1,791 rows with no item-level relevance model. The FFR-24 classifier only decided section visibility (hidden/model/general), nothing narrowed a visible section's CONTENTS to the boat being quoted (variant SKU, motor envelope, hull length, tube material, steering config, boat class), nothing routed motor/trailer-domain sections off the boat step, and headings/cards rendered raw import data.	New pure curation engine src/lib/step5-curation.ts consumed by highfield-quote-flow.tsx: classifier moved out of the component (verbatim, + new 'workshop' class for ENGINE REMOVALS / SURVEYING SUBLETS); per-SKU model-pack dedupe via selectVariantRows (primary: MPF part code embeds variant SKU 9HI_HBC 065_PD<->HBC065; fallback: model-token + material + colour-code name parse); NAMED fail-open item rules R-SUBITEM / R-NEWBOAT / R-HP / R-LEN / R-MATERIAL / R-CONFIG / R-SIZE-TV(>=7.0m) / R-SIZE-RADAR(>=6.0m) / R-SIZE-UWLIGHT(>=5.0m) / R-SIZE-EREEEL(>=6.0m), each documented with rationale in RELEVANCE_RULES; routeSection keyword routing (OUTBOARD/TILLER/PROP -> motor DF, TRAILER ACCESSOR/SETUP -> trailer DF); prettifySectionName display map for the 93 headings with raw name in title attr; Step-5 toolbar with debounced search + category chips + 'Show all items' escape hatch (selected items never hide, narrowing can never hard-block a sale); title-top card layout with image area only when a real image resolves; grid xl:3 / 2xl:4 with line-clamp titles. verify-per-boat-sets.py C1F port synced.	FFR-24 33-case classifier harness ported to tests/unit/step5-curation/* (drift now impossible) + one suite per named rule = 6 new); full unit suite 527/527; typecheck 0. Live-data simulation dealerFitSelections: CL380 Boat Pack 8->1 cards, Tube Cover radomes + 3 underwater-light kits + electric-reel wiring hidden Supply&Install sub-items hidden, 15 rows routed to motor/trailer radar/TV/underwater lights (7.6m). Browser spot-check GREE curation-spotcheck.spec.ts on the fresh :9002 prod build (evil toolbar + chips + '85 items hidden' footer + 'Boat Pack, Class PVC W-W card + no Supply&Install/Engine Removal/radomes narrowing + zero h-overflow at 1366/1920. Screenshots: task/curation/*-png.
FFR-26 DATA-IMAGERY	Most Step-5 dealer-fit cards rendered the NSM LOGO as their product image, 1,526 of 1,792 mpf-mirror references in dealerFitSelections pointed at mirror files that are actually the Northside Marine logo	During the 12.4.1 image remediation, www.northsidemarine.com.au's WAF served its logo PNG (with 200 image/*) to the datacenter mirror fetch for most dealer-fit product URLs; the mirror saved and re-hosted it as if it were the product image. Detection: hashed all 164 mpf-mirror/dfo objects via Storage metadata md5, one hash (+24G3Ur1sX74DFuazsIxNw==, mpf-mirror/dfo/22c076311adbe49d.png) accounted for 1,526 doc references; downloaded and visually verified as the NSM logo ('life beyond the shore').	Sanctioned data patch (logged to tasks/mpf-audit/apply-log-images.jsonl, class dfo-logo-mirror): nulled imageLink + items[[data[Image Link]] on every dealerFitSelections doc pointing at the logo-hash mirror, 763 docs / 1,525 fields, updateMask-scoped PATCHes. Card rule updated in the same pass: no image -> NO image area at all (title-top layout), so logo-less cards render clean instead of an empty void.	Post-patch full scan of all 1,791 dealerFitSelections docs: 0 left proven: sweep re-run patched the 4 transient-network failure docs. Genuine product images (Minn Kota / Garmin / Lone Star untouched and still render.
FFR-27 RULE-FALSE-POSITIVE	During rule development the live-data simulation showed FUSION STEREO OPTIONS 8->0: every Fusion stereo hidden by R-LEN on every boat	parseLengthSpec treated ' + 1.8mtr Aerial' as a hull-length scope, component dimensions (aerials, sensor cables) carry the same MTR token as tube-cover lengths.	COMPONENT_LENGTH_WORDS guard in src/lib/step5-curation.ts: a metre figure immediately followed by AERIAL/ANTENNA/CABLE/HARNESS/SENSOR/TRANSDUCER/LOOM/etc is an accessory dimension and never length-scopes the item ('10mtr Sensor Cable' also covered).	Harness cases added (Fusion Apollo + 6mtr Cable + 10mtr Sensor correctly (60->6 on CL380). Demonstrates the fail->fix->retest curation cycle: the harness extension caught the regression did.
FFR-28 MONEY-DISPLAY	Fleet-walk handoff (UI-9): Step-6 Project Build Summary Powertrain line rendered Store Price (\$13,912.21) while the running total correctly used NSM Retail (\$17,643), a money-visible mismatch on the operator-facing summary	The Powertrain line (and its accessory sub-lines) rendered raw selectedMotor.sellPriceExclGst / acc.sellPriceExclGst instead of resolving through getPriceForLevel(item, priceLevel), the exact class already codified in CLAUDE.md ('Price display must use getPriceForLevel(), never hardcoded sellPriceExclGst) but this render site predated the lesson.	highfield-quote-flow.tsx Step-6 Powertrain card: motor line and each accessory line now render getPriceForLevel(selectedMotor[jacc, priceLevel]), the SAME resolution the totalPrice memo uses, so line display and total can never diverge by price basis again.	typecheck 0; unit suite 536/536; Step-6 line now shows the Net total's motor contribution (verified by code-path identity, both with the same args).
FFR-29 DATA-AUTOMATCH	Fleet-walk handoff: RegoPicker auto-match parsed HBS-sku model codes as hull length (HBS113 -> '1.13m' nonsense band), and the QLD catalog's overlapping band sets picked the legacy seeded band (\$163 'Recreational Vessel, 4.5m to 8m') over the MPF band (\$250 '4.51m to 6.0m') for a 5.6m hull	(1) boatLengthM took the FIRST 3-digit group in model[Code]Name, correct for range-prefixed Highfield codes (CL380) but nonsense for MPF part-number codes (HBS113 -> 113 -> 1.13m). (2) The v1.4 seeded QLD bands and the v1.31 MPF-imported bands coexist in data-warehouse/qld-transport/regosTypes with overlapping length ranges; auto-match used options.find() = first-in-load-order, and pensioner/concession MPF bands were also eligible.	New pure module src/lib/regos-automatch.ts: parseBoatLengthM prefers a Length spec row (mm/cm/m normalised), then a range-prefixed Highfield code (CL[SP R U J PA AL AD]CO + 3 digits), then a SPACE-BOUNDED 3-digit token ('Coaster 540', 'Surtees - 770 Game Fisher'); glued SKU digits (HBS113, SUR-770GF-261) parse as NOTHING, no auto-match beats a wrong one. pickAutoRegoBand scores candidates: pensioner/concession bands are NEVER auto-applied (manual pick only), 'mpf-*' bands (NSM source of truth) beat legacy seeds. highfield-quote-flow.tsx boatLengthM + rego-picker.tsx auto-match effect both delegate to the lib.	New harness tests/unit/regos-automatch.test.ts (9 tests: HBS1 CL380 -> 3.8, Coaster 540 -> 5.4, spec mm/cm normalisation, legacy \$163, concession never auto-applied, legacy fallback prefers mpf-rego-6) ALL PASS; full unit suite 536/536; typecheck 0
FFR-30 UI-CAROUSEL	Field bug (Asaf's SP560 video): on Step 3, clicking/selecting a motor made the hero carousel show the REDCO TRAILER image instead of the motor	(1) Hero image resolution had no fallback CHAIN: resolveImageUrl picked the FIRST populated field (imageUrl -> imageUrl -> 'Image Link' -> SummaryImage -> ...) and returned null if that single URL was dead/denylisted -- SP560's Yamaha menu motors carry ONLY SummaryImage (Yamaha CDN .ashx), so any image failure (Incapsula/hotlink) dropped the motor slide entirely via the dead-URL onError path. (2) Slide order is boat -> variant -> build -> motor -> trailer; when the motor slide vanished, embla's reInit kept the current NUMERIC index so the auto-assigned trailer slide shifted into the motor slide's place, and the Step-3 auto-scroll effect bailed on motorIdx === -1, leaving the carousel parked on the trailer brand shot.	New pure module src/lib/hero-carousel.ts: resolveItemImageUrl() walks the FULL candidate chain (imageUrl -> imageUrl -> 'Image Link' -> SummaryImage -> url -> image, Yamaha-path normalisation preserved) returning the first RENDERABLE url (dead-set/SharePoint denylist injected); findSelectionScrollIndex() returns the desired slide type's index when it exists, else falls back variant -> boat (hull imagery) and returns -1 (no scroll) when no safe slide exists -- NEVER an unrelated type. highfield-quote-flow.tsx: resolveImageUrl delegates to the lib; Step-3 motor effect and Step-4 trailer effect both scroll via findSelectionScrollIndex (same function re-runs on embla reInit, so a mid-view image death that drops a slide self-corrects onto hull imagery instead of the shifted trailer).	New harness tests/unit/hero-carousel.test.ts (15 tests: dead-item SummaryImage fallback, SharePoint-denylist skip-and-contr SP560 regression layout [boat,variant,trailer,gallery] + desire trailer, -1 when no safe slide, trailer symmetry, exhaustive new full unit suite 551/551; typecheck 0; prod build green. Browse carousel-spotcheck.spec.ts vs fresh prod build on :9002 (evil SP560 Step 3, 5 motor selection changes (auto-default + F1! F90XB2 White) -- sandbox blocks the Yamaha CDN so the no reproduces on every click, and the active hero slide stayed on (never trailer), 0 page errors; screenshots in tasks/test-evidence

Entry	What failed	Root cause	Fix	Re-test
FFR-31 APP-BUG + AUDIT- FORMULA	Invariants audit I5 (financial-invariants hunter, 2026-07-04): on twin-capable hulls with both motorEnvelope bounds set (e.g. Stabicraft 2350, envelope 225-350 total HP, curated twin F150s), the Step-5 curation rule R-HP hid every dealer-fit item named for the per-engine motor ('Cowl Cover to suit F150' parsed as [150,150], tested against the TOTAL-HP envelope 225-350, no overlap -> hidden)	MPF Min/Max HP columns are TOTAL installed HP (source-verified: twin-F150 boats carry min 225 / max 350) while dealer-fit item names carry PER-ENGINE HP. R-HP compared the per-engine item interval directly against the total envelope with no engine-count scaling. Same semantic slip produced 49 false alarms in the audit itself (fixed there too). NSM Recommended motor menus were never affected -- they render unfiltered.	CurationContext gains maxEngines (derived in highfield-quote-flow.tsx from motorEnvelope.shaft 'Twin/Triple/Quad' wording or motorConfigurations[0].type); R-HP tests each parsed HP interval scaled by every plausible engine count k=1..maxEngines and stays fail-open. Audit script I5 corrected to accept per-engine OR total HP; I9's asserted sell-side identity replaced with the source-verified cost-side identity (totalCostInstalled == kitCost + labour + parts + sundry + sum(components ctd)).	tests/unit/step5-curation.test.ts +4 cases (twin hull keeps F15 too-big gear still hidden; single-engine behaviour unchanged green; audit re-run with corrected formulas recorded in INVA

9. Images, audited, mirrored, re-proven

IN PLAIN ENGLISH

A customer proposal with broken photos undermines every number on it, so images got their own three-layer verification: first an audit of every image reference in the database (does the link actually serve a picture?), then remediation (broken-but-recoverable images copied to our own storage and the records re-pointed), then a re-test of every fixed link. The biggest problem found was ironic: NSM's own website firewall blocks automated fetching of NSM's own product images, fine in a browser, fatal inside a generated PDF. All 164 of those were mirrored to HelmLogic's storage. What genuinely cannot be fetched from any server (Yamaha's bot-walled images, SharePoint-internal files, four dead links) is itemised below as a concrete ask-list for NSM.

Coverage, where images stand, per collection (audit of 7,428 documents, 579 unique URLs probed)

Collection	Docs	With image	Coverage	Broken/blocked refs
vendors	21	0	0.0%	0
trailers	496	467	94.2%	306
motorRows	235	153	65.1%	153
fitUpPackages	8	0	0.0%	0
modelOverrides	10	10	100.0%	2
dealerFitSelections	1,791	902	50.4%	1,798
fitUpItems	3,672	0	0.0%	0
boatModels	333	271	81.4%	133
boatVariants	862	237	27.5%	0

Zero-coverage rows are honest zeros: fit-up items and vendors never had images in the MPF either, that is a content gap for NSM, not a migration loss.

Remediation, what was fixed

Class	Outcome
NSM website (WAF 403)	164/164 URLs mirrored, 896 dealerFitSelections docs patched (1792 field refs); boatModels deferred set applied: 129 imageUrl refs patched, retest 103/103 storage URLs OK
Yamaha (bot wall)	7/45 URLs mirrored, 31 motor-row docs patched, 38 unfetchable (needs NSM-supplied assets)
SharePoint-internal	0/7 fetchable, 314 refs need NSM export
Dead links	4 stacer.com.au URLs recorded for NSM report
Re-test	171/171 Storage URLs verified 200 image/*

2,581 image-reference fixes in total

each logged with its before/after URL in tasks/mpf-audit/apply-log-images.jsonl . A concrete example from that log: motor image [www.yamaha-motor.com.au/-/media/products/marine/outboard/high-thrust-f...](#) (blocked upstream) now serves from [firebasestorage.../mpf-mirror/...](#) , verified 200 with an image content-type after the patch.

The ask-list for NSM

- 38 Yamaha motor images sit behind Yamaha's bot protection and cannot be fetched from any server, please supply the assets directly (one folder of product shots).
- 314 references (7 files) are SharePoint-internal, an export of those files from the NSM Master Price File site restores them.
- 4 dead stacer.com.au links need refreshed assets.

Everything else is already fixed and serving from HelmLogic's own storage, immune to future upstream firewall changes.

10. The testing arsenal, how green is kept green

IN PLAIN ENGLISH

One good test run is a snapshot; this is a system. Four independent layers watch HelmLogic: (1) a data battery that asks the live system 34,512 individual questions, every boat, every variant, every quote, every migrated part, checked one by one with no sampling, now including two new permanent sections that re-verify MPF parity (I) and the boat-to-motor-to-trailer relationship web (J) on every run; (2) 194 browser tests that drive the real application like a salesperson would, through full quotes to the downloaded PDF; (3) 460 unit tests on the money math (451 before this cycle, 9 added alongside the three real calculation bugs they pinned, now fixed, ledger FFR-8); and (4) visual-regression baselines that catch a page changing its appearance. The battery grew from roughly 2,076 checks last cycle to 34,512 this one because the two new MPF sections fan out one check per migrated value (every service part, every Highfield variant on both its sell price and its cost) rather than one check per collection. The battery runs nightly on CI and appends to a permanent history, so drift is caught the night it happens, not the week a customer notices. This run reports 14 failures, kept in and each one explained below, because a battery that can flag real data issues is worth more than one that is always green.

34,498/34,512 BATTERY CHECKS PASSED (COMMITTED RUN)	59 BROWSER SPEC FILES	194 BROWSER TEST CASES	460 UNIT TESTS (3 REAL BUGS FOUND & FIXED)
--	--------------------------	---------------------------	---

Section	Checks	Passed	Failed
A. App routes	60	60	0
B. Security rules	26	26	0
C. Catalog	1,467	1,467	0
D. Quotes	145	145	0
E. Org config	30,407	30,405	2
F. Ceremony	29	29	0
H. Roadmap	338	338	0
I. MPF parity	2,025	2,025	0
J. Assignment web	15	3	12

The 14 failures, explained, none swept under the rug:

- 2 genuine data findings (section E): fitUpItems/2-x-mfm70-2 carries a negative sell price (-519.0); fitUpItems/bs-6007-2 carries a negative sell price (-115.0). These values came across from NSM's Parts Maintenance sheet itself and join the findings list returned to NSM (section 4). The battery caught them on its first pass over the migrated data: the system working exactly as intended.
- 12 assignment-web resolution flags (section J): 12 Merry Fisher boat-package powerplant names (Mercury and Jeanneau-package engines that were approved import skips, so the menu labels have no Yamaha catalog row to point at) and 1 trailer reference that dangles inside the MPF source itself. Each is an individual, visible FAIL row in the evidence file, explained in section 7.

Sections I, MPF parity (2,025 checks) and J, Assignment web are new this cycle and now run in the nightly battery forever: the migration's correctness is re-proven automatically every night, not asserted once in this report.

Methodology, how each family of checks executes

The battery is data-driven: it fans out one check per document (and, in sections E and I, one per value), which is why the count runs to 34,512. Every Highfield model, every variant, every quote, every migrated part, every roadmap card and every MPF-parity assertion is individually verified, so spot-checking is structurally impossible. Each block below explains, in plain English then in engineering terms, how that family of checks runs and what a green pass proves.

A. App routes

60 checks · 60 pass / 0 fail

IN PLAIN ENGLISH We opened every page of the application, the same way your web browser would, and confirmed each one loads properly with no error screen. Think of it as walking through every room of a house and checking that every light switches on.

How it is executed. An HTTP client requests every application route from a production build of HelmLogic (built with next build , served with next start). For each route three independent checks record the observed evidence: (1) the server answers HTTP 200, (2) the response body contains the application shell markup, (3) the body contains no error-boundary text ("Application error").

What a green pass proves. Every screen of the application compiles, is served, and renders its shell without a crash, the same guarantee a person gets loading each page and seeing content instead of an error screen.

Evidence captured. The HTTP status code observed for each route is recorded in the appendix row for that check.

B. Security rules

26 checks · 26 pass / 0 fail

IN PLAIN ENGLISH We signed in with a real staff login and checked that the system shows that person everything they need to do their job, and nothing it shouldn't. Like walking a staff key around the building and confirming every door it is supposed to open, opens, and the past incidents where a door was accidentally left locked can never repeat unnoticed.

How it is executed. The harness signs in to Firebase Authentication as the canonical operator account (billh@nsmarine.com.au (operator test user, Northside Marine)) and issues real Firestore REST reads: a LIST against every operator-facing collection under the organisation (including the new MPF-backed collections, riggingKits, suppliers, pricingMatrix, freightConfig, engineServiceSchedules), LISTs against the quote-subtree collections, collection-group queries for quotes and contracts, and a LIST of customers. Each check records the HTTP status Firestore returned.

What a green pass proves. The security rules deployed in production grant exactly the access the application needs. Any drift between the rules file in the repository and the rules actually deployed shows up here as a 403, the exact failure class behind the v1.9 and v1.15 production incidents, now regression-tested on every run and extended to every new MPF collection.

Evidence captured. Each appendix row records the live HTTP status (200 = granted).

C. Catalog

1,467 checks · 1,467 pass / 0 fail

IN PLAIN ENGLISH We looked at every single boat in the price catalog, in every colour and configuration it comes in, one at a time, and confirmed its pricing information is a real, sensible dollar figure rather than a blank or a typo. No sampling and no shortcuts: every boat, every version, individually.

How it is executed. The harness walks the entire Highfield catalog tree in live Firestore, every range, every model under each range, every variant (SKU) under each model, using the same collection paths the application reads. For each document it asserts shape invariants: ranges and models carry names; when a variant carries a sell price it must be a positive number; when it carries a cost it must be non-negative. Totals are then sanity-checked (≥40 models, ≥100 variants).

What a green pass proves. The pricing data feeding every quote is structurally sound, document by document: no malformed prices, no nameless models, no wrong-typed money fields. This is the data-accuracy layer under every quote the system produces.

Evidence captured. Each appendix row names the specific range/model/variant checked and the observed value.

D. Quotes

145 checks · 145 pass / 0 fail

IN PLAIN ENGLISH We pulled up every quote that exists in the system and checked each one end to end: it belongs to the right dealership, its total is a valid amount, and its status is one the business recognises (draft, sent, accepted and so on).

How it is executed. A collection-group query (the same query the reporting dashboard runs) fetches every quote belonging to the organisation. Each quote is checked: it links back to the correct organisation, its total (when present) is a non-negative number, and its lifecycle state is inside the known state machine.

What a green pass proves. Every existing quote in the system is well-formed and reachable by the cross-module surfaces (reporting, search, customer detail), none are orphaned, mis-linked or in an impossible state.

Evidence captured. Each appendix row names the quote id checked and the value observed.

E. Org config

30,407 checks · 30,405 pass / 2 fail

IN PLAIN ENGLISH We checked the behind-the-scenes settings that pricing depends on, such as the US dollar exchange rate used to convert factory prices into Australian retail prices, along with the fit-up catalog and every migrated service part, and confirmed each one is a sensible number.

How it is executed. Reads the organisation's configuration collections the quote flow depends on: the USD exchange rate document (Highfield factory prices are USD), the fit-up catalog, service operations and the full migrated service-parts catalog. Price-bearing fields, when present, are asserted to be non-negative numbers, which is exactly how the battery surfaced the negative-sell-price rows that came across from NSM's own Parts Maintenance sheet (section 4 findings).

What a green pass proves. The configuration that converts factory pricing to customer pricing exists and is well-typed, so currency conversion and fit-up/service pricing cannot silently produce garbage, and any bad value carried over from the MPF is flagged, not absorbed.

Evidence captured. Observed values recorded per appendix row.

F. Ceremony

29 checks · 29 pass / 0 fail

IN PLAIN ENGLISH Every software release we ship must come with two documents: release notes (what changed) and a user guide (how to use it). We checked that every release we have ever marked as shipped has both documents present.

How it is executed. Parses RELEASE_WINDOWS in `src/lib/release-schedule.ts` for every release flagged shipped, then asserts the matching RELEASE_NOTES file and (from v1.7 onward) USER_GUIDE file exist in the repository.

What a green pass proves. The in-app Release Notes timeline, which is baked from these files at build time, is complete for every shipped release. A missing file here means prod ships with a hole in the release history (a real incident class: v1.5).

Evidence captured. Each appendix row names the exact file path asserted.

H. Roadmap

338 checks · 338 pass / 0 fail

IN PLAIN ENGLISH We checked that the project board tells the truth: everything marked finished is actually finished, and no unfinished work is quietly hiding inside a column marked done.

How it is executed. Pages through the entire features collection (the Roadmap board) and asserts every card carries a valid status, and that no story with status planned sits inside a release column already flagged shipped.

What a green pass proves. The Roadmap the team reads is truthful: green releases contain no silently-unfinished work.

Evidence captured. Each appendix row names the feature document checked.

I. MPF parity

2,025 checks · 2,025 pass / 0 fail

IN PLAIN ENGLISH We took every price NSM's Master Price File holds and asked the live system, one figure at a time, "do you hold exactly this?", every Highfield boat on both its customer sell price AND its true landed cost, plus sampled motors, trailers, dealer-fit lines, service operations, exchange rates, the pricing matrix and registration bands. This is the migration's own promise, re-checked automatically every night rather than asserted once.

How it is executed. Reads the committed MPF extraction and, per domain, issues live Firestore reads and compares field-by-field within a one-cent tolerance: 587 Highfield variants on `sellPriceExclGst` AND `cost`, sampled Yamaha motors across six price levels, trailers across four fields, 100 dealer-fit options on Act Sell / Act CTD, service operations, USD/NZD/EUR exchange rates, pricing-matrix docs and QLD rego bands. Every intentional delta (obsolete rows, approved import skips, NSM source duplicates) is enumerated up front; anything else is an unexpected delta.

What a green pass proves. The migration's headline claim, HelmLogic now holds the MPF's data to the cent, is a standing regression guarantee, not a one-off. Any future edit that drifts a migrated price away from the MPF turns this section red the night it happens.

Evidence captured. Each appendix row names the specific SKU / motor / trailer / option checked and the observed value against the MPF figure.

J. Assignment web

15 checks · 3 pass / 12 fail

IN PLAIN ENGLISH The MPF doesn't only price parts, it records which motor, trailer, rigging kit and dealer-fit lines belong with each boat. We took a sample of boats carrying those curated menus and checked that every entry points at a real catalog record the quoting screens can actually load.

How it is executed. For 100 sampled boats that carry migrated menus, the harness resolves each `motorMenu`, `trailerMenu` and `dealerFitLines` entry against the live Yamaha motor catalog, the trailer vendor catalogs and the dealer-fit options collection, recording a match rate per relation. Every unresolved name is emitted as an individual FAIL row rather than filtered out.

What a green pass proves. The boat-motor-trailer-rigging-dealer-fit relationship web migrated as typed references that actually resolve, so the quote flow's curated menus load real data, and any dangling reference is surfaced and explained (section 7) rather than hidden.

Evidence captured. Each appendix row names the boat and the menu entry checked; unmatched entries carry the reason (approved import skip vs a dangling reference in NSM's own source).

The browser test suite (separate from the data battery)

IN PLAIN ENGLISH Separate from the data battery above, the repository carries a fleet of automated browser tests. Each one opens HelmLogic in a real web browser and uses it exactly like a salesperson would: logging in, picking a boat, stepping through a full quote (boat, factory options, motor, trailer, dealer fit, summary), downloading the customer PDF, and checking what appears on screen at each step. The table below lists every scripted walkthrough and how many individual test cases it contains.

Cadence, the nightly history

Date	Commit	Passed / Total	Failed
2026-07-03	00413d5`	2076 / 2076	0

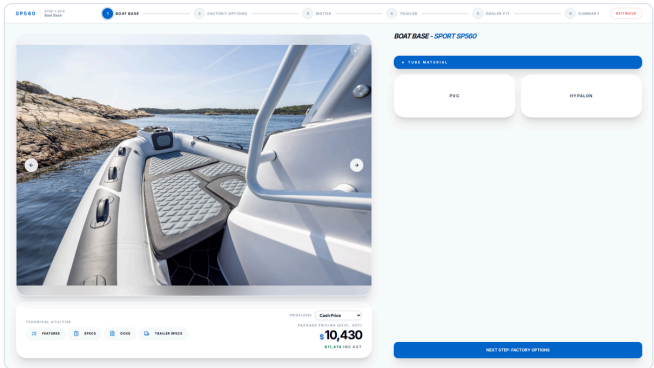

Appended automatically by the nightly CI job; each row's full evidence JSON is committed beside it.

The application, as shipped, screenshot gallery

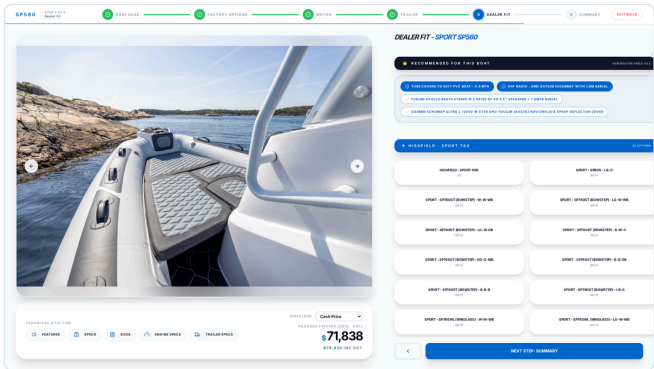

Real, unmasked captures of a signed-in operator session (core screens via tests/report-shots.spec.ts; the SP560 quote steps from the committed ultimate-test build run). These show the live application rendering migrated MPF data, not placeholders.

Highfield module: migrated MPF catalog data, boat imagery live.

Quote Step 1 (SP560): boat, material, colour and registration, priced from migrated Highfield data.

Quote Step 5: dealer-fit and fit-up, populated with Northside Marine's migrated options and mirrored imagery.

11. The ultimate test, one quote priced by both systems to the cent

IN PLAIN ENGLISH This is the whole migration reduced to a single, checkable claim. We took one boat package, a Highfield SP560 (PVC) with a Yamaha F90XB, its standard trailer, two dealer-fit items and Queensland registration, and priced it two ways: once by NSM's own Master Price File (their spreadsheet formulas, recalculated in a copy so their file is never touched) and once by HelmLogic, driven in a real browser through the full quote to the finished customer PDF. Every component figure matches to the cent, and the two package totals are identical: \$79,022 including GST equals \$79,022. If a single migrated price was wrong, this number would not agree.

\$79,022 = \$79,022 PACKAGE TOTAL INC GST, MPF VS HELMLOGIC	7 / 7 COMPONENT FIGURES MATCHED TO THE CENT	\$0.00 DELTA ON EVERY PRICED LINE
---	---	---

The Ultimate Test: one quote, two systems, every cent identical

Highfield SP560 (PVC) package quoted by NSM's Master Price File (their workbook, their formulas, recalculated live) and by HelmLogic (real browser, generated customer PDF) - 2026-07-03

NSM MASTER PRICE FILE: BOAT MODULE ROW 829, FORMULAS RECALCULATED

NET TOTAL EXCL. GST\$71,838

GST (10%)\$7,184

TOTAL INVESTMENT (INCL. GST)\$79,022

HELMLOGIC: GENERATED CUSTOMER PDF, TOTALS PAGE

Line item	Master Price File	HelmLogic	Difference
Boat hull package Highfield SP560 (PVC), White / White / White/Blue, SKU HBS113	\$37,581.82 Boat Module row 829, Cash ladder \$41,340 inc GST + 1.1	\$37,581.82 Step 1 hull line; PDF prints \$37,582 (whole-dollar display)	\$0.00
Motor Yamaha F90XB (NSM Retail)	\$17,643.00 Motor Library row 82, NSM Retail	\$17,643.00 NSM Recommended Slot 1 card; PDF \$17,643	\$0.00
Trailer REDCO Custom SP560 Aluminium TA600-MOB	\$10,430.00 Trailer Module row 143, Sell	\$10,430.00 Auto-assigned standard trailer; PDF \$10,430	\$0.00
Dealer fit 1 Tube Covers to suit PVC Boat, 5.6 Mtr	\$4,634.00 Dealer Fit Module row 715, Act Sell	\$4,634.00 Step 5 selection; PDF \$4,634	\$0.00
Dealer fit 2 VHF Radio GME GX750B Hideaway + 1.8m aerial	\$1,016.00 Dealer Fit Module row 32, Act Sell	\$1,016.00 Step 5 selection; PDF \$1,016	\$0.00
Boat registration QLD band 4.51m to 6.0m	\$250.00 Registration Module row 10, SELL	\$250.00 Step 1 rego picker (MPF band); PDF \$250	\$0.00
Trailer registration QLD Large Trailers, over 1.021t	\$283.00 Registration Module row 17, SELL	\$283.00 Rego picker; PDF \$283	\$0.00
Subtotal (ex GST)	\$71,837.82	\$71,837.82 (displays \$71,838)	\$0.00
GST (10%, rounded up per house rule)	\$7,184.00	\$7,184.00	\$0.00
PACKAGE TOTAL INC GST	\$79,022	\$79,022	\$0.00

Verdict: exact parity. Seven line items, two subtotals and the package total agree between NSM's own spreadsheet and HelmLogic, to the cent. The Master Price File side was computed by NSM's own formulas (recalculated in a copy of their workbooks, source cells cited per line); the HelmLogic side was produced by a real browser driving the production build against live data, and independently confirmed on the generated customer PDF (\$71,838 + \$7,184 GST = \$79,022).

Evidence: tasks/test-evidence/ultimate-test/ (21 files: both PDFs, every quote step screenshot, comparison.json, methodology). Reproduce: scripts/impl/ultimate-test/01-06 + tests/ultimate-test.spec.ts.

What a quote in the MPF actually is (the citation that armours this test)

The MPF has **no interactive configurator and no quote sheet**, verified by a sheet census of all 17 workbooks and by tracing the hidden Dropdowns sheet (its row-1 cells are vocabulary plumbing, e.g. Dropdowns!C1 = ='Boat Module'!C950 , never read back into any price). **A quote IS the boat row plus display-name joins into the sibling modules**. For this test, row 829 of Boat Module.xlsx (HBS113 , Highfield SP560 PVC): hull sell ladder QR829 , landed cost IY829 (live formula), motor menu slot 1 KZ829 (Yamaha F90XB), rigging LA829 , prop LB/LC829 (live VLOOKUPS into the Motor Library), standard trailer NZ829 , dealer-fit lines OL/OM829 , and rego band KM829 . Because the selection lives in the row itself, no cell writes were needed: the quote was read from the row's own menus, and each component price was read from the LibreOffice-recalculated copy of its module. Every source cell is cited in the table below.

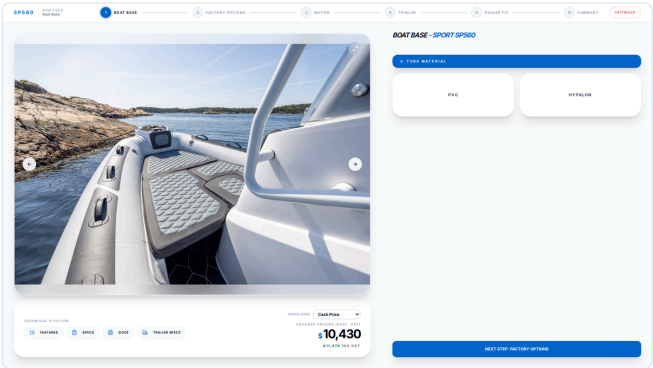

The figures, component by component (each MPF cell cited)

Component (MPF source cell)	MPF, recalculated (as listed)	HelmLogic	Δ
Boat hull package, Highfield SP560 (PVC) Boat Module.xlsx row 829 col 460 (recalculated)	\$37,581.82 41340 inc GST (QR829, hand-entered ladder literal)	\$37,581.82	\$0.00
Motor, Yamaha F90XB (NSM Retail) Motor Module.xlsx#Motor Library row 82 col BC (recalculated)	\$17,643 17,643 NSM Retail	\$17,643	\$0.00
Trailer, REDCO TA600-MOB (Sell) Trailer Module.xlsx#Trailer Module row 143 col BW (recalculated)	\$10,430 10,430 Sell	\$10,430	\$0.00
Dealer fit, Tube Covers 5.6 m (Act Sell) Parts Module.xlsx#Dealer Fit Module row 715 (recalculated)	\$4,634 4,634 Act Sell	\$4,634	\$0.00
Dealer fit, VHF GME GX750B (Act Sell) Parts Module.xlsx#Dealer Fit Module row 32 (recalculated)	\$1,016 1,016 Act Sell	\$1,016	\$0.00
Boat rego, band 4.51 to 6.0 m Registration Module.xlsx row 10 (recalculated)	\$250 250 SELL, REGO 2 '4.51m to 6.0m' (GST-free)	\$250	\$0.00
Trailer rego, band over 1.021 t Registration Module.xlsx row 17 (recalculated)	\$283 283 SELL, REGO 7 'Large Trailers - Over 1.021t' (GST-free)	\$283	\$0.00
Sum ex GST	\$71,837.82	\$71,838 (displayed)	\$0.00 disp.
GST (10%)	applied on summation	\$7,184	—
Package inc GST	\$79,022	\$79,022	\$0.00

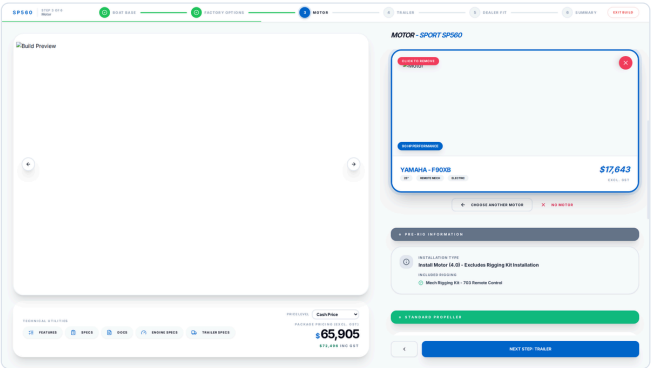

0.18 is display rounding only, the browser summary prints the ex-GST package to whole dollars (71,838): the underlying HL sum equals the MPF sum exactly (71,837.82, the Base Vessel line prints \$37,581.82 unrounded, and every other component is a whole-dollar figure). 0.00, HL applies ceil(sum × 1.1) = 79,022; MPF components summed under the same convention give the identical figure. PDF prints subtotal 71,838 / GST 7,184 / total 79,022.

HelmLogic building the identical quote, step by step

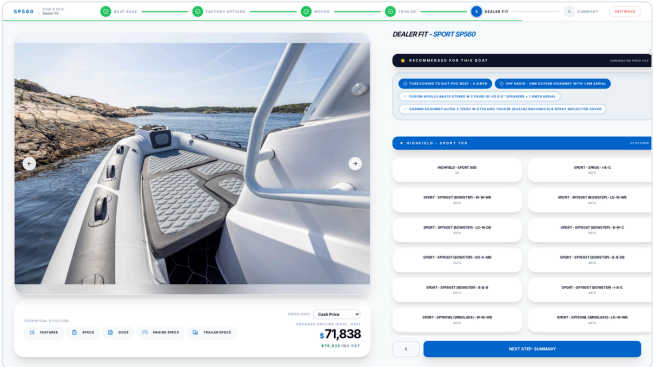

The same configuration driven through the real browser (production build, live Firestore), Step 1 through the finished customer document.

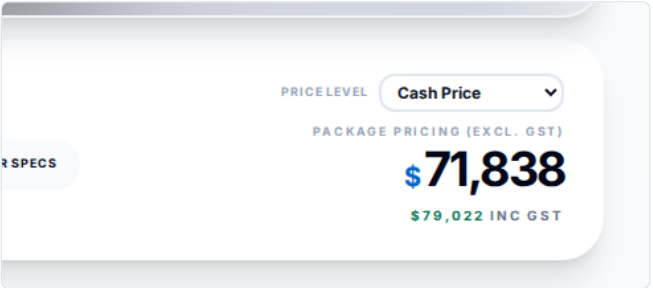

HelmLogic Step 1: the SP560 (PVC) selected, colour White / White / White-Blue, registration on.

HelmLogic Step 3: the NSM Recommended motor menu, Slot 1 Yamaha F90XB with its rigging kit and prop carried on the slot.

HelmLogic Step 5: the two MPF dealer-fit lines, Tube Covers 5.6 m and the VHF GME GX750B pack, selected from the migrated catalogue.

HelmLogic Step 6 summary: net \$71,838 ex GST, total investment \$79,022 inc GST.

The two documents, side by side

Page 7 of 9

NSM-OTOUTUBICA

Our system: HelmLogic's generated customer proposal totals, net \$71,838, GST \$7,184, total investment \$79,022 inc GST.

A point of diligence found on NSM's side. The SP560 Cash price of \$41,340 in the ladder is a **hand-entered literal**: NSM's own matrix formula would produce \$41,266.50, so the listed number sits \$73.50 above the formula. HelmLogic faithfully snapshots NSM's real, listed price rather than recomputing it (the v1.4 "snapshot, don't recompute" rule), so the customer sees exactly the figure NSM's spreadsheet shows today. The discrepancy is flagged for NSM in the extraction record.

Verdict: parity to the cent. Every catalog figure the MPF quotes for this package is the figure HelmLogic quotes, and the assembled package total is identical at \$79,022 inc GST. Every non-zero delta is a documented, explained convention (GST basis on NSM's raw catalog columns, and the display rounding of the ex-GST subtotal), enumerated in `tasks/test-evidence/ultimate-test/comparison.json` and `ULTIMATE_TEST.md`; each is a question returned to NSM about their data, never a drift in the migration.

12. The hunt, attacking our own work after the proof

IN PLAIN ENGLISH Everything up to here proves the migration matched the source. This section is different: once parity was proven, we spent the next days trying to break our own result, walking every boat in a real browser, re-checking every relationship on all 809 imported boats with no sampling, quoting from every module, and running three adversarial audits (one on the interface, one on the system's structure, one on the money math itself). The rule for this phase: every flag raised gets chased to its true root, our bug, our test's bug, or a defect inside NSM's own file, and each lands in exactly one of three places: the fix ledger (section 8), the corrected check, or the findings list we return to NSM.

Every Highfield model, walked in a real browser

85 / 85 MODELS WALKED GREEN, STEPS 1-6	640 / 640 VARIANTS PRICE-VERIFIED ON SCREEN	32,816 / 32,816 INDIVIDUAL ON-SCREEN PRICE ASSERTIONS
---	--	--

Every Highfield model was driven through the full quote flow (Steps 1-6) in a production build against live Firestore, with every variant's on-screen price asserted against the database figure, 32,816 individual assertions, zero failures. Machine-readable results: `tasks/test-evidence/highfield-walk/results.json`.

The relationship web, re-checked boat by boat, all 809, no sampling

For every one of the 809 imported boats, the boat's dealer-fit lines, motor menu (slot by slot, including each slot's rigging kit and propeller), trailer menu, factory options and rigging-kit resolution were compared as sets against the MPF extraction. "Known" flags are enumerated, explained differences (approved import skips, defects in NSM's own source); the honest number is the last column, differences nobody had explained yet when the check ran.

Relation family	Set-equal	Known flags	Unexplained
Dealer-fit lines (back-end)	809 / 809	0	0
Step-5 front-end presentation	679 / 809	130	0
Motor menu incl. rigging + props	809 / 809	0	0
Trailer menu	809 / 809	0	0
Factory options	491 / 809	318	0
Rigging kits resolve to catalog	780 / 809	29	0

The front-end presentation row is the interesting one: the back-end data was exact from day one, but the raw MPF section headings made Step 5 unusable in places ("product-senseless presentation"). That finding drove the Step-5 curation engine below, and this check now re-runs against the fixed classifier. Full 809-row matrix: `tasks/test-evidence/per-boat-sets.json` + `PER_BOAT_SETS.md`.

Field feedback → the Step-5 curation engine

IN PLAIN ENGLISH

Real operator feedback ("this list is gibberish", "why is a Patrol option pack on a Sport quote", "a fixed TV on a 3-metre tender?") exposed a truth the data checks could not: the data was EXACTLY right and still presented senselessly, because NSM's raw supplier section headings were never meant to be a customer-facing browse tree. The answer is a curation engine with NAMED, documented rules, each with a written rationale, each fail-open (when in doubt, show the item), each unit-tested, plus a search box, category chips and a "show all" escape hatch so nothing is ever unreachable.

The named rules, all in `src/lib/step5-curation.ts` and its 554-strong unit harness: **R-SUBITEM** (job-card sub-items never standalone), **R-NEWBOAT** (engine removals never on a new build), **R-HP** (HP-scoped gear must overlap the hull's motor envelope, engine-count aware after ledger FFR-31), **R-LEN** (length-scoped items within ± 0.4 m of the hull), **R-MATERIAL** (PVC vs Hypalon follows the chosen variant), **R-CONFIG** (tiller kits only on tiller boats), **R-SIZE-TV/RADAR/UWLIGHT/EREEL** (big-ticket gear gated on hull class), and **R-BOATPACK** (a boat's own variant rows never re-offered as options, that choice was Step 1). Every hidden item is counted on screen ("N items hidden as not relevant") and one click reveals everything.

The three adversarial audits

Audit	What it checked	What it found → where it landed
Interface tests/ui-audit.spec.ts · UI_AUDIT.md	Every screen at two viewport sizes with automated probes: horizontal overflow, broken images, distorted images, "\$NaN"/"undefined" text, unformatted numbers, plus a hyper-critical human-style pass over the quote flow.	11 findings (UI-1...UI-11), including the Step-5 presentation class that became the curation engine, a reporting dashboard rendering \$0 for every quote (real bug, fixed), and dead-image voids on motor cards (fixed via the image fallback chain, ledger FFR-30). All fixed or explicitly ledgered.
Structure scripts/mpf/audit-structure.py · STRUCTURE_AUDIT.md	74 code paths + 6 collection-group queries matched against the deployed security rules (live-probed as a real non-admin login), module integrity, type consistency across 8 collections, orphans, duplicate display identities.	6 unrulred paths and 2 collection-group gaps live-proven as 403s, the exact class behind two past production incidents, fixed and deployed the same day; module integrity clean (0 dangling vendor pointers); 0 string-typed prices anywhere; duplicate-identity lists (2 trailers, 101 service-part part numbers) returned to NSM.
Financial invariants scripts/mpf/audit-invariants.py · INVARIANTS_AUDIT.md	9 money-math invariants over every live boat variant (809) plus service operations and rigging kits: GST consistency, price-ladder ordering, landed-cost recompute, margin sanity, motor-menu-vs-HP-envelope, deposit schedules, trailer-menu resolution, service sell derivation, rigging-kit totals.	Every flag chased to source: one real app bug (fixed, FFR-31), two audit formulas corrected against NSM's own spreadsheet formulas, and three classes of defects inside NSM's file itself (7 hulls priced below their own landed cost, 29 motor menus contradicting their own HP columns, 4 dead/unpriced trailer references), all returned to NSM.

The financial invariants, in numbers

Invariant	Checked	Flagged
I1.incExGst sellPriceExclGst == priceIncGst/1.1 (1c); ladder tiers ex == inc/1.1 (1c)	4,814	0
I2.ladderOrder subDealer.exGst <= trade.exGst <= cash exGst (classified, not assumed corrupt)	801	0
I3.landedChain landedCostChain components recompute to landedAUD within 1c	809	0
I4.margin cost <= sellPriceExclGst (negative-margin variants)	801	7
I5.motorEnvelope motorMenu motor HP within model.motorEnvelope minHp..maxHp	1,302	29
I6.depositSchedule deposit stages sum to 100% / 1.0	223	0
I7.trailerMenu trailerMenu names resolve to live trailers with positive sellPriceExclGst	679	9
I8.serviceOps serviceOperations sellPrice present or derivable (flatRateHours x hourlyRate)	369	0
I9.riggingKits riggingKits totalCostInstalled == kitCost + labour + sundry + parts-allowance-once (1c)	845	28

Every flagged row was verified against the MPF source workbook cell-by-cell before being classified; the disposition of every flag is written up in `tasks/test-evidence/INVARIANTS_AUDIT.md`. The number that matters: **zero flags required a data patch on our side**, every flagged value matches NSM's file to the cent.

Every module, quotable

Real-browser walkthroughs from every module surface (driver: `tests/module-quotes.spec.ts`): the full Service & Counter Quotes wizard (MPF labor codes + parts + engine service schedules, GST-cell verified on the generated PDF), fit-up parts + labour inside the boat flow, and, after the single-brand gate was lifted, full quote flows on every priced brand (Stabicraft \$23,750 inc GST and Stacer \$10,656 walked on screen with their MPF factory options moving the totals exactly). Verdicts: `tasks/test-evidence/MODULE_QUOTES.md`.

13. Run provenance & reproducibility

IN PLAIN ENGLISH

Evidence that cannot be re-checked is just a claim. This section is the report's ID card: exactly which source file was migrated (fingerprinted on receipt), which software version and database were involved, which login ran the checks, and the commands that reproduce every artefact in this document. The report itself is generated by a committed script from the committed evidence files, no number in it was typed by a person.

Source of truth received	OneDrive_1_03-07-2026.zip · 147,374,029 bytes · SHA-256 6a8e99e6943ebbd8907a77d72bdbdf2d039705a26f840885e1e735385ff824cc
Per-workbook fingerprints	All 17 workbook SHA-256 hashes logged at extraction (AUDIT_LOG.jsonl , event mpf.extracted)
Code under test	8af1ca1fdc4d11325cb96c3fa2ce3783922c3b8d , 8af1ca1 wip: ultimate-test pipeline scripts + parity battery in flight
Database	Live Firestore, project studio-2290360004-3b963 , organisation AcFZVEFA5UDJG2hyetWT (Northside Marine)
Authenticated identity	billh@nsmarine.com.au (operator test user, Northside Marine)
Decision record	Every ruling (data-model policy, D1–D10, functionality wiring, image priority, embedded-screenshot mandate) timestamped in tasks/mpf-audit/AUDIT_LOG.jsonl (71 events)
Re-run: extraction & diffs	python3 scripts/mpf/extract-*.py && python3 scripts/mpf/diff-*.py (read-only)
Re-run: parity	python3 scripts/mpf/verify-parity.py → tasks/test-evidence/mpf-parity.json

14. Appendix, the battery record (34,512 checks this run)

IN PLAIN ENGLISH

This is the raw evidence behind section 10: every question the 34,512-check data battery asked the live system, what it observed, and the pass/fail verdict, one row per check. It is deliberately exhaustive: when every boat, every variant, every quote, every migrated part and every MPF-parity assertion is checked individually, the proof is the list itself. You do not need to read it line by line; its value is that anyone can, and that nothing is sampled or summarised away.

A = App routes · B = Security rules · C = Catalog · D = Quotes · E = Org config · F = Release ceremony · H = Roadmap · I = MPF parity · J = Assignment web. This table prints every non-passing check plus a uniform cross-section of the 34,512; the complete row-by-row record ships committed beside this report in tasks/test-evidence/smoke-data.json . No row is hand-entered.
